ABSTRACT

A green and convenient method for the synthesis of a variety of xanthene derivatives by condensation reaction between aldehydes and β-naphthol or dimeredone in an micellar solution of sodium dodecylphosphonate is described. This method offers several advantages, such as using of a cheap and environmentally benign reaction media, low loadings of sodium dodecylphosphonate as catalyst and easy work-up.

Keywords: β-Naphthol, Dimeredone, Aldehydes, Micellar media, Sodium dodecylphosphonate, Xanthenes.

1. Introduction

Since that heterocyclic compounds are widely used in various fields of sciences and technology, the preparation of these compounds, especially xanthene's derivatives is an important part of synthetic organic chemistry. These compounds can be used as dyes [1], in laser technologies [2], fluorescent spectroscopy [3] and peptide synthesis [4]. In addition, xanthenes are reported as important antibacterial [5], antiviral [6] and anti-inflammatory agents [7]. Many synthetic methods exist for the synthesis of 14-aryl-14H-dibenzoanthenes, including the cyclocondensation reaction of 2-hydroxyaromatic aldehydes and 2-tetralone [8], the reaction of benzaldehyde and acetophenone [9], and the condensation of β-naphthol with alkyl or aryl aldehydes. The xanthene synthesis by the later method is promoted by many acidic catalysts such as; H₂SO₄/AC₂O [10], p-toluene sulfonic acid [11], sulfamic acid [12], Montmorillonite K10 [13], Amberlyst-15 [14], K₃CO₅/W₆O₁₉·3H₂O [15], cellulose [MIMPS]H₅SO₄ [16], iodine [17], cyanuric chloride [18], LiBr [19], HClO₄·SiO₂ [20], KAl(SO₄)₂·12H₂O [21], silica sulfuric acid [22], dodecyl phosphonic acid [23], Yb(OtF)₃ [24], PEG-OsO₄·H [25], H₃PW₁₀V₂O₄₀ [26] and saccharin sulfonic acid [27].

Despite the widely applications of acidic catalysts in synthesis of xanthene's derivatives, alkaline catalysts have not been considered. Only one alkaline catalyst has been reported which is sodium lauryl sulphate [28].

The best procedure for the synthesis of 1,8-dioxo-octahydroxanthenes is the condensation of dimeredone with aldehydes. This reaction is catalyzed by silica chloride [29], ferric hydroger sulfate [30], Vanadatesulfuric acid nanorod particles [31], PPA-SiO₂ [32], DABCO [33], TMSCl [34], silica-supported H₁₄[Na₅PₓW₁₅O₆₅] nanoparticles [35], SbCl₅/SiO₂ [36] and ZrO(OTf)₂ [37]. However, reported procedures have considerable drawbacks for example low yields, long reaction times, difficulties in work-up, use of an excess of reagents/ catalysts, harsh reaction conditions, and use of toxic organic solvents. Therefore, development of more efficient route for the synthesis of xanthenes is still needed. Recently, the use of water as reaction media has recieved much attention in organic synthesis. Because water is the cheapest, most plentiful and non-toxic chemical in environment. On the other hand, surfactants among the most important materials used in almost every chemical industry, including detergents, paints, dyestuffs, cosmetics, pharmaceuticals, agrochemicals, fibers and plastics [38]. These compounds have bifunctional chemical structure. Therefore, they can cause the organic

reactions to be performed in aqueous media at the critical micelle concentrations point (CMC). Sodium dodecylphosphonate (Na$_2$DP) is a solid alkaline surfactant (Scheme 1). Here in, we have used it as an efficient micellar and basic catalyst for the synthesis of xanthene derivatives from aldehydes and $\beta$-naphthol or dimedone in aqueous media.

2. Experimental

NMR spectra were recorded on a Bruker (1$^\text{H}$NMR 400 MHz and 13$^\text{C}$NMR 100 MHz). IR spectra were obtained using a Vertex 70 Bruker FT-IR 8300 spectrophotometer. Melting points were determined in open capillary tubes in a Büchi-545 circulating oil melting point apparatus and for the conductivity measurements of the sodium dodecylphosphonate and determination of CMC, a Metrohm Model 721 conductivity meter was used. Material purchased from Fluka, Aldrich and Merck Chemical Companies.

2.1. Preparation of benzoxanthenes and 1,8-dioxo-ocathydroxanthenes in the presence of sodium dodecylphosphonate

A mixture of the aldehyde (1 mmol), $\beta$-naphthol (2 mmol) or dimedone (2 mmol) and sodium dodecylphosphonate (3.2 mg) was added to 5 ml of water. The reaction mixture was refluxed at 100$^\circ$C for the appropriate time (Table 2 and 3). With progress of the reaction, the corresponding product was precipitated in reaction vessel. Completion of the reaction was determined by TLC. Then the mixture was centrifuged and filtrated. The solid product was isolated without any more purification.

Selected spectral data:

1- (2- hydroxynaphthalen-1-yl) (phenyl) methyl naphthalen-2-ol (Table 2, Entry 6):

Oil; IR (KBr): $\tilde{\nu} = 3214, 3083, 1417, 1111, 760; 1^\text{H}$NMR (400 MHz, CDCl$_3$): $\delta = 5.50$ (s, 1H, CH), 6.61 (s, 2H, OH), 6.99-8.60 (m, 17H, ArH); $13^\text{C}$NMR (100 MHz, CDCl$_3$): $\delta = 29.7, 117.3, 118.0, 122.7, 124.2, 126.4, 126.8, 128.2, 128.4, 128.8, 131.0, 131.4, 145.0, 148.8, 151.1, 151.4.

4- (bis(2- hydroxynaphthalen-1-yl) methyl) benzonitrile (Table 2, Entry 7):

White solid; m.p. = 225-227$^\circ$C, IR (KBr): $\tilde{\nu} = 3206, 2237, 1622, 1602, 1514, 1258, 1210, 1140, 814, 743, 552; 1^\text{H}$NMR (400 MHz, CDCl$_3$): $\delta = 5.31$ (s, 1H, CH), 6.86 (s, 2H, OH), 7.05-7.29 (m, 5H, ArH), 7.35-7.48 (m, 7H, ArH), 7.51-7.92 (m, 4H, ArH); $13^\text{C}$NMR (100 MHz, CDCl$_3$): $\delta = 29.7, 110.3, 117.3, 118.0, 122.7, 124.2, 126.4, 126.8, 128.2, 128.5, 128.8, 131.0, 131.4, 135.0, 148.7, 151.1, 151.4.

9-(2,4-dichlorophenyl)-3,4,6,7-tetrahydro-3,3,6,6-tetramethyl-2H-xanthene-1,8 (5H,9H) -dione (Table 3, Entry 4):

White solid; m.p. = 254$^\circ$C; IR (KBr): $\tilde{\nu} = 2967, 1706, 1590, 1493, 1376, 1314, 1213, 1048, 761, 699; 1^\text{H}$NMR (400 MHz, DMSO-d$_6$): $\delta = 0.93$ (s, 6H, 2CH$_3$), 1.08 (s, 6H, 2CH$_3$), 2.05-2.14 (m, 4H, 2CH$_2$), 2.15-2.50 (m, 4H, 2CH$_2$), 4.50 (s, 1H, CH), 7.00-7.46 (m, 3H, ArH); $13^\text{C}$NMR (100 MHz, DMSO-d$_6$): $\delta = 27.9, 29.6, 32.7, 33.8, 34.3, 43.8, 48.9, 50.2, 110.3, 129.4, 129.8, 132.2, 134.0, 134.5, 141.7, 169.8, 198.3.

3. Results and Discussion

The current paper describes a green and easy method for the synthesis of xanthene derivatives. At the beginning, to optimize the reaction conditions, the critical micelle concentrations (CMC) of sodium dodecylphosphonate (Na$_2$DP) in pure water were determined by conductometry method. In Fig. 1 the conductivity vs. concentration of Na$_2$DP are presented in water at room temperature. In order to estimate the values of CMC, we fit the linear fragments, above and below the breaks and we treat the concentration at which intersection of these lines occurs as the CMC. The CMC was obtained 1.6 mM.

Then, we studied the reaction of 4-nitrobenzaldehyde (1 mmol) and $\beta$-naphthol (2 mmol) in different amounts of sodium dodecylphosphonate in water at reflux conditions (Fig. 2). The best result was obtained in 1.4 CMC (3.2 mg) of Na$_2$DP (Table 1, Entry 2) and use of higher amount of the catalyst did not show further increase in the conversion or shorter reaction time.

After that, the generality of this method was tested by

A probable mechanism was reported in Fig. 2.

In line with our studies, we decided to examine reactivity of sodium dodecylphosphonate in the synthesis of 1,8-dioxo-octahydroxanthenes. In optimized conditions for the preparation of benzoxanthenes, we studied the behavior of a range of aldehydes in the reaction with dimedone. The obtained results from this study were shown in Table 3.

As it is shown in Table 3, aromatic aldehydes including electron-withdrawing and electron-donating groups created the corresponding 1,8-dioxo-octahydroxanthenes in high yields. This can be probably related partially to the more acidity strength of α-hydrogen in dimedone vs 2-naphtol. While the cyano- and nitro- derivatives of aldehydes were converted to corresponding diols.

A comparison among this catalyst (Na$_2$DP) and sodium lauryl sulphate for the synthesis of benzoxanthenes shows clearly that Na$_2$DP promote the reaction more efficiently than sodium lauryl sulphate [28].

4. Conclusions

In this paper, an efficient, green and safe methodology for the preparation of 14-aryl-14H-dibenzoaxanthenes and 1,8-dioxo-octahydroxanthenes was reported. On the other hand, acyclic intermediates that are produced in current reaction (Table 2, Entries 6 and 7, Table 3, Entries 8 and 9) are important ligands for the synthesis of organometallic compounds [39]. Furthermore, this method offers several additional advantages such as high conversion, employ of green media, clean reaction profiles, simple experimental and work up procedures.
